Why delta>0: strictly positive, finite tilted/nominal ratio (synthetic B_toy, not a FairShip result)
Tilted/nominal ratio, UA_d0p1_a16 (strongest available exploitation)
pdg=-13
pdg=13
pi_tilt / pi_nominal (log scale)
rank (sorted rows, nominal-positive support)
Utility transform with vs without the delta floor
delta=0.1 (support-preserving floor)
delta=0.0 (reference, touches zero)
h_alpha_delta(u), alpha=16 (log scale)
u
Support preservation is relative to the finite empirical nominal population. It does not prove that the available dataset covers all physically relevant SHiP regions.
